Wakeplane in production

Hosted reports. Local work. Recorded outcomes.

Operator case study | Captured October 26, 2026

Wakeplane 1.0 is a scheduling control plane. This deployment uses a private Railway service for reports and a Mac Mini for local scripts. The screenshots are exact crops with opaque privacy masks. Visible UI pixels and report text are preserved.

Hosted reports

The daemon, automation runner and Postgres are separate services. Postgres and runner state have persistent volumes. The runner handles Discord and Gmail delivery.

On October 26, the weekday repository report and Monday release digest succeeded on their first attempts. The Discord message was read back, and the Gmail message was confirmed in INBOX. Provider acceptance and inbox placement were checked separately.

Local work stays local

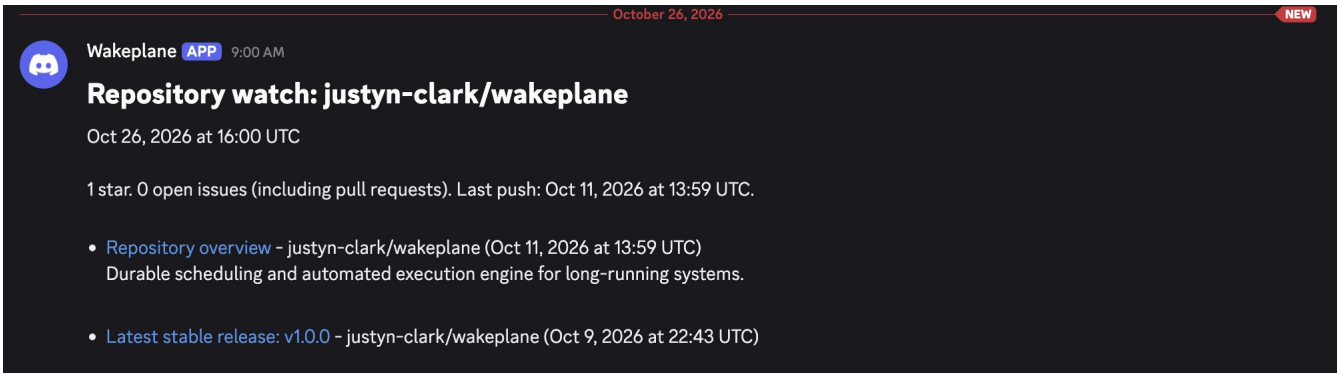

Four existing jobs now use Wakeplane schedules. Python and Hermes still perform the work. launchd supervises the daemon; SQLite stores its run history. Article publication still requires human approval.

Job	America/Los_Angeles
Docs drift	Weekdays 08:45
Activity ingest	Daily 20:15
Article preview	Mondays 08:30
Preview watchdog	Mondays 09:45

Schedule	Status	Try	Times	Duration	Target
weekly-article-preview-watchdog ·	succeeded	1	created Oct 26, 09:45:04 AM · started Oct 26, 09:45:06 AM · finished Oct 26, 09:45:06 AM	418ms	shell
docs-drift-weekdays ·	succeeded	1	created Oct 26, 08:45:04 AM · started Oct 26, 08:45:06 AM · finished Oct 26, 08:46:17 AM	71.67s	shell
weekly-article-preview ·	succeeded	1	created Oct 26, 08:30:04 AM · started Oct 26, 08:30:06 AM · finished Oct 26, 08:34:07 AM	241.16s	shell
daily-content-signal-ingest ·	succeeded	1	created Oct 25, 08:15:04 PM · started Oct 25, 08:15:06 PM · finished Oct 25, 08:15:16 PM	9.34s	shell
daily-content-signal-ingest ·	succeeded	1	created Oct 24, 08:15:01 PM · started Oct 24, 08:15:02 PM · finished Oct 24, 08:15:12 PM	10.04s	shell

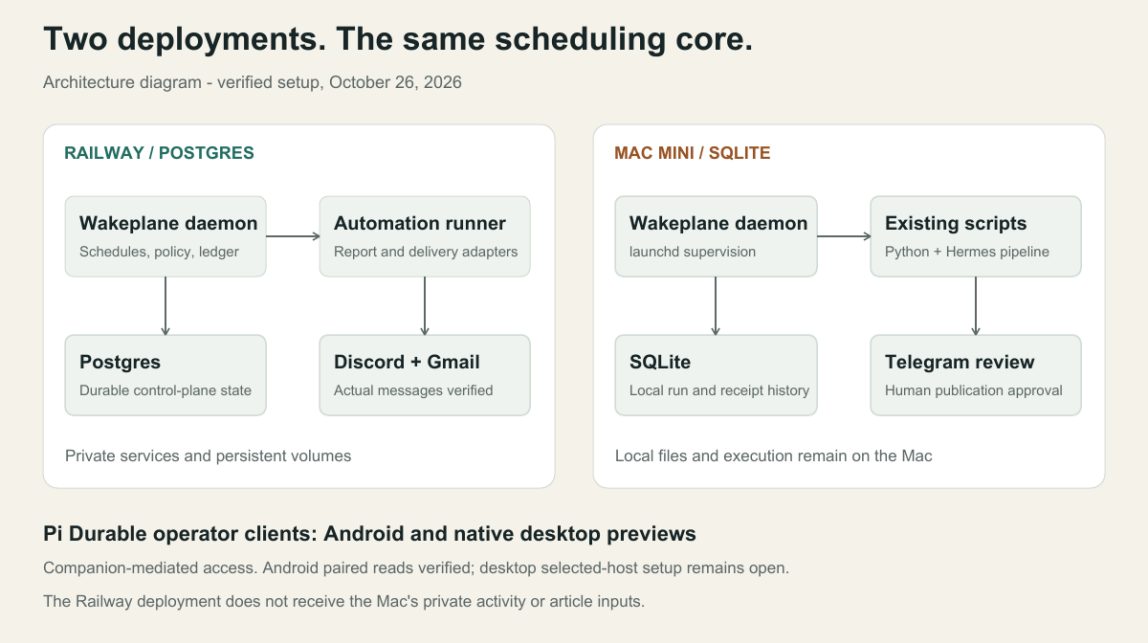

Each migrated job forbids overlap, runs once if late, allows one concurrent execution and permits one attempt. The old schedule owners were disabled at cutover. An October 19 article-preview failure remains recorded; October 26 succeeded. The case study makes no claim of uninterrupted success.

Delivery and system boundaries

A real scheduled report

The visible report is the October 26 repository watch delivery. Browser chrome, private channel navigation and account details were cropped out. It is a dated example, not a live service-health indicator.

Companion previews

Pi Durable Android companion reads of Wakeplane 1.0.0 were verified with native approval, request correlation and no schedule mutations. Its screenshot is an emulator fixture. Physical-phone acceptance remains separate. The selected native desktop companion still needed Wakeplane configuration at inspection.

Run your own

Wakeplane 1.0 supports a single operator on trusted infrastructure. Documentation: wakeplane.dev. Source and releases: github.com/justyn-clark/wakeplane. See installation, hosting, recipes and the stable contract for supported interfaces and limits.
